

KEA

Data design

Product description

The product is a platform for deploying, managing, and scaling machine learning models in production. It offers a secure, flexible environment for automating ML tasks like model versioning, routing, and monitoring. With Kubernetes integration and containerization support, it's designed for developers, ML engineers, and enterprises needing scalable, reliable ML infrastructure.

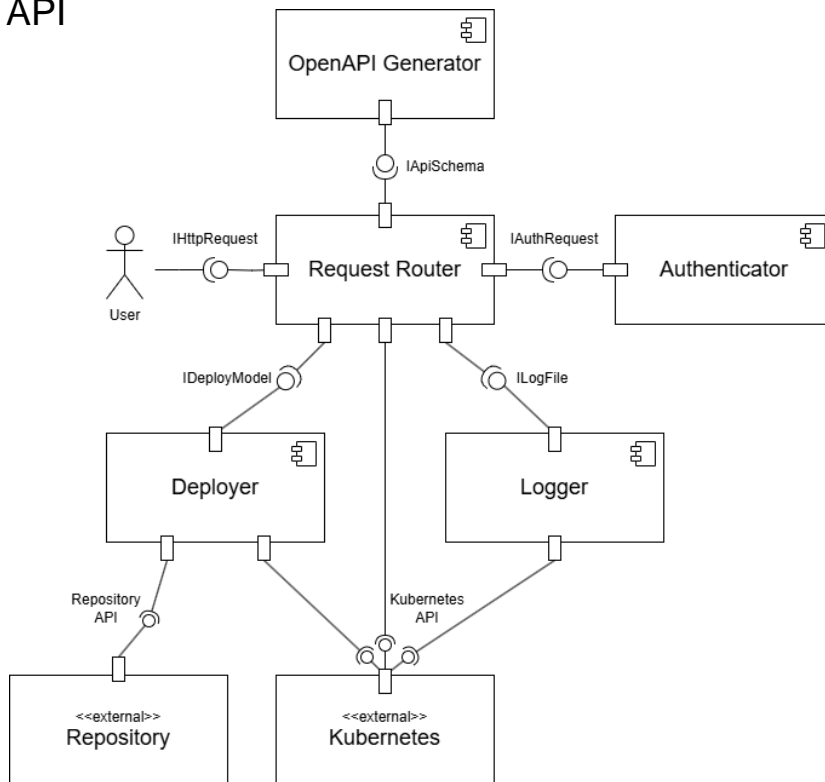

Team K8C: Tsurkan Daniel; Dandamaev Gadji; Tsaturyan Konstantin; Smolkin Mikhail

Project repo: <https://github.com/fanglores/Advanced-Software-Design>

This report: [https://github.com/fanglores/Advanced-Software-Design/blob/master/Practice%20Tasks/Module2/Task 12/Task 12.pdf](https://github.com/fanglores/Advanced-Software-Design/blob/master/Practice%20Tasks/Module2/Task%2012/Task%2012.pdf)

System architecture

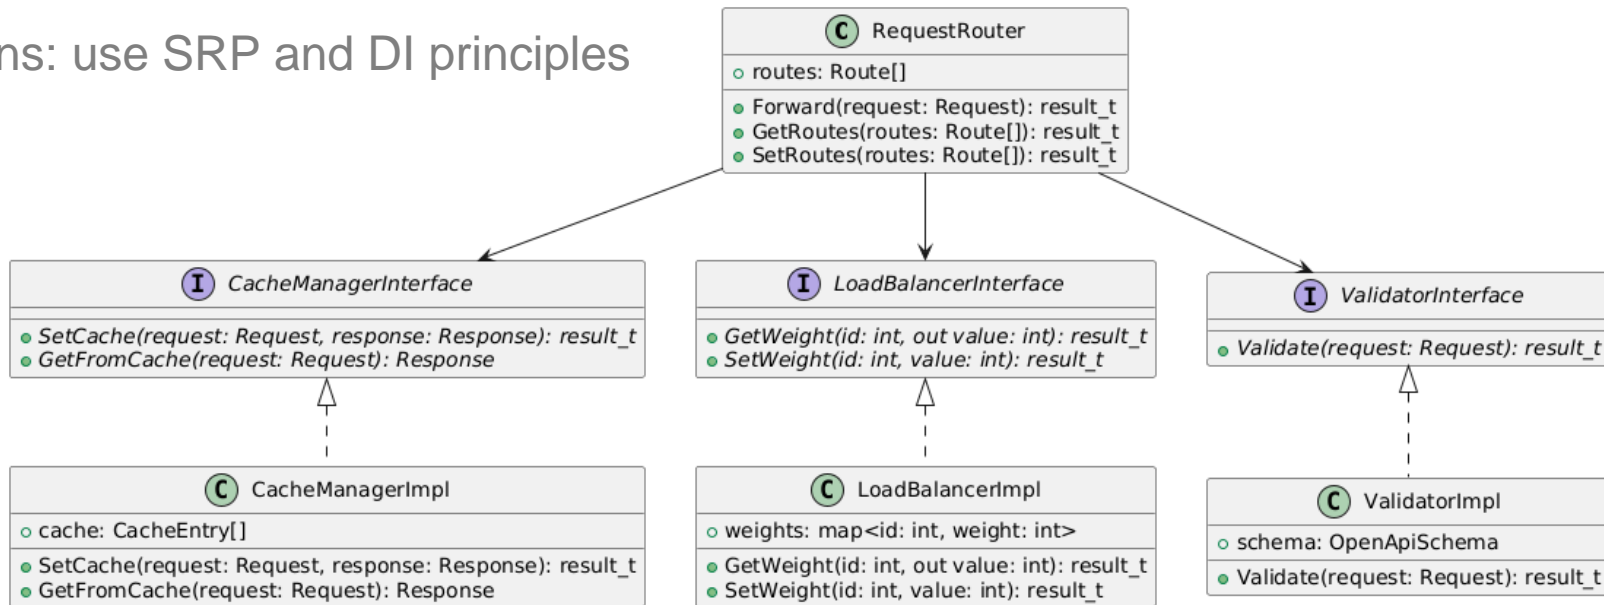

BASE, Microservices, RESTful API

Design case for RequestRouter

Problems: many functions for one class

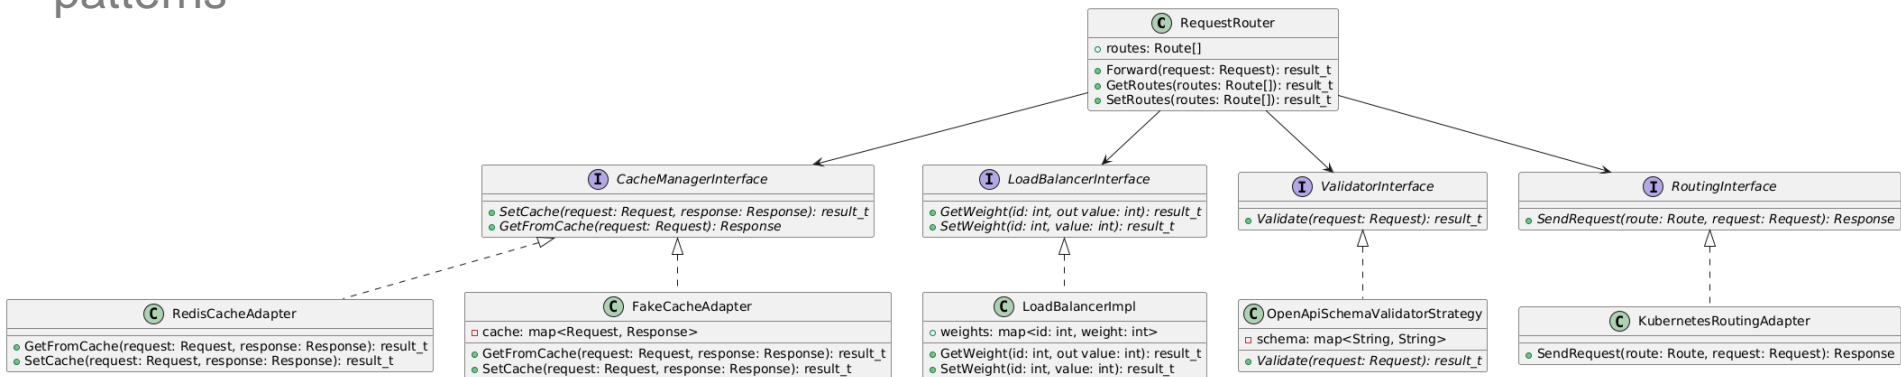

Solutions: use SRP and DI principles

Design case for RequestRouter

Problems: strong dependency on
Kubernetes, OpenAPI schemas,
cache storage

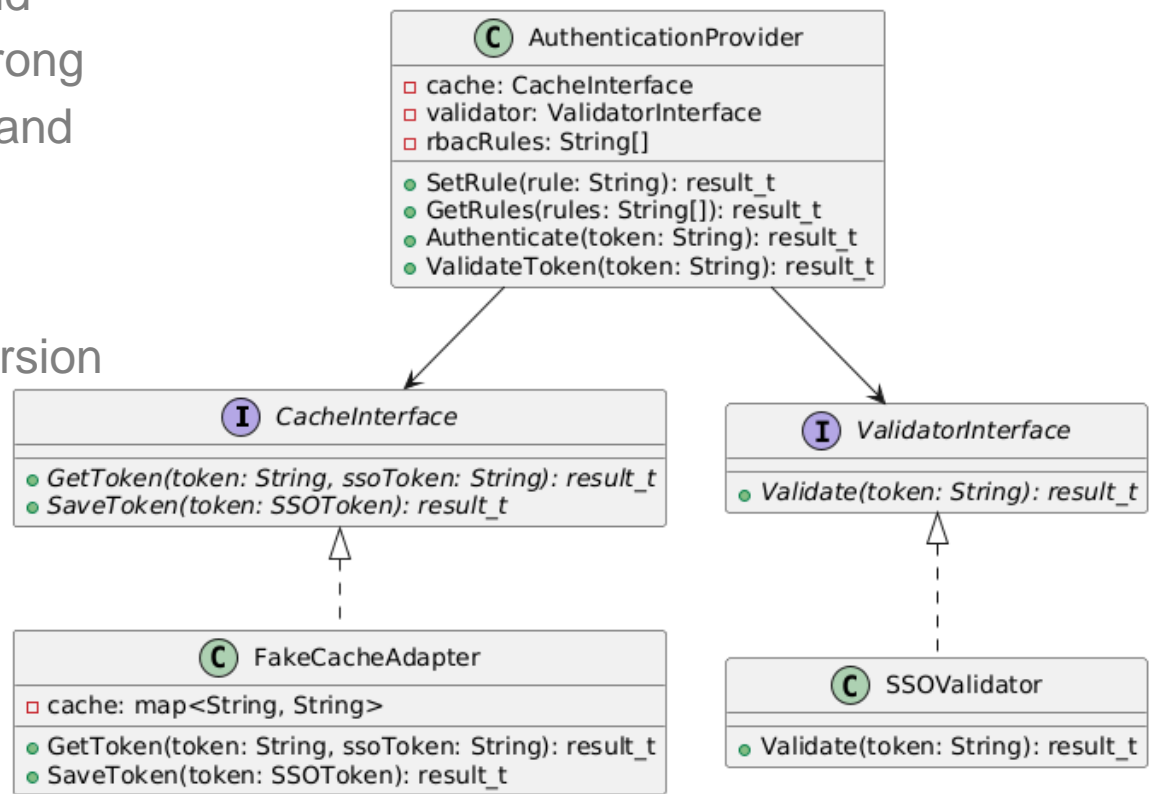

Solutions: use Strategy and Adapter
patterns

Design case for Authenticator

Problem: caching, validating and authentication are all in one, strong dependency on cache storage and token type

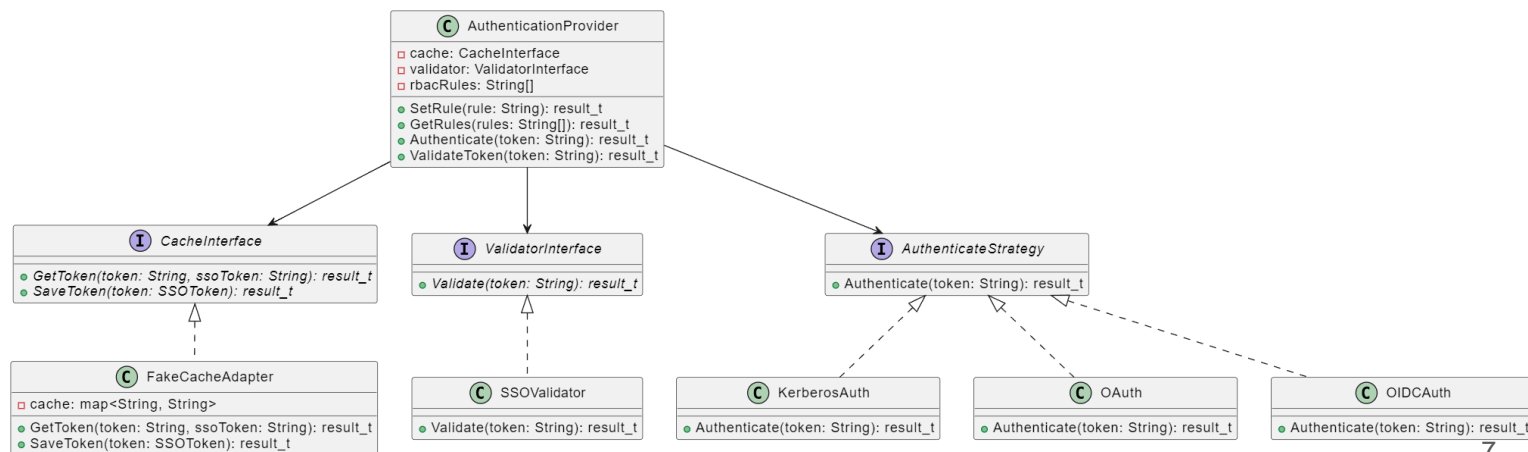

Solution: use Dependency inversion principle, interface for different tokens and Adapter pattern

Design case for Authenticator

Problem: all auth-processes are implemented in AuthenticationProvider

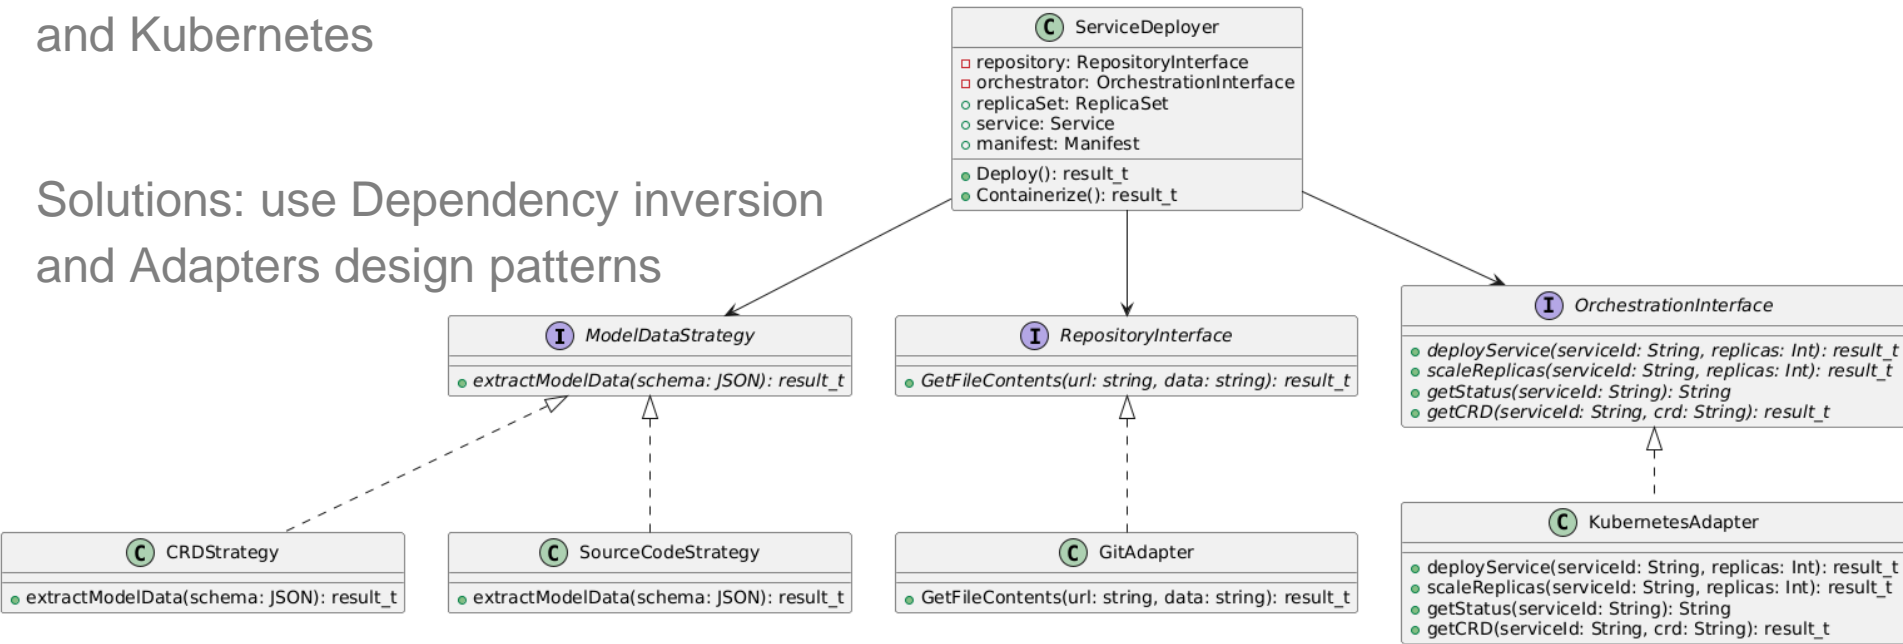

Solution: use Strategy pattern for separating different auth-protocols

Design case of Service Deployer

Problems: need to work with different data (source code from repo or CRD), strong dependency on repo and Kubernetes

Solutions: use Dependency inversion and Adapters design patterns

Design case of Service Deployer

Problems: applying for new deploy strategies requires changes in ServiceDeployer

Solutions: use Strategy pattern for Ideploy Strategy
