

# KEA

Data design

# Product description

The product is a platform for deploying, managing, and scaling machine learning models in production. It offers a secure, flexible environment for automating ML tasks like model versioning, routing, and monitoring. With Kubernetes integration and containerization support, it's designed for developers, ML engineers, and enterprises needing scalable, reliable ML infrastructure.

**Team K8C:** Tsurkan Daniel; Dandamaev Gadji; Tsaturyan Konstantin; Smolkin Mikhail

/blob/master/Practice%20Tasks/Module2/Task 12/Task 12.pdf](https://github.com/fanglores/Advanced-Software-Design/blob/master/Practice%20Tasks/Module2/Task%2012/Task%2012.pdf)

---

# System architecture

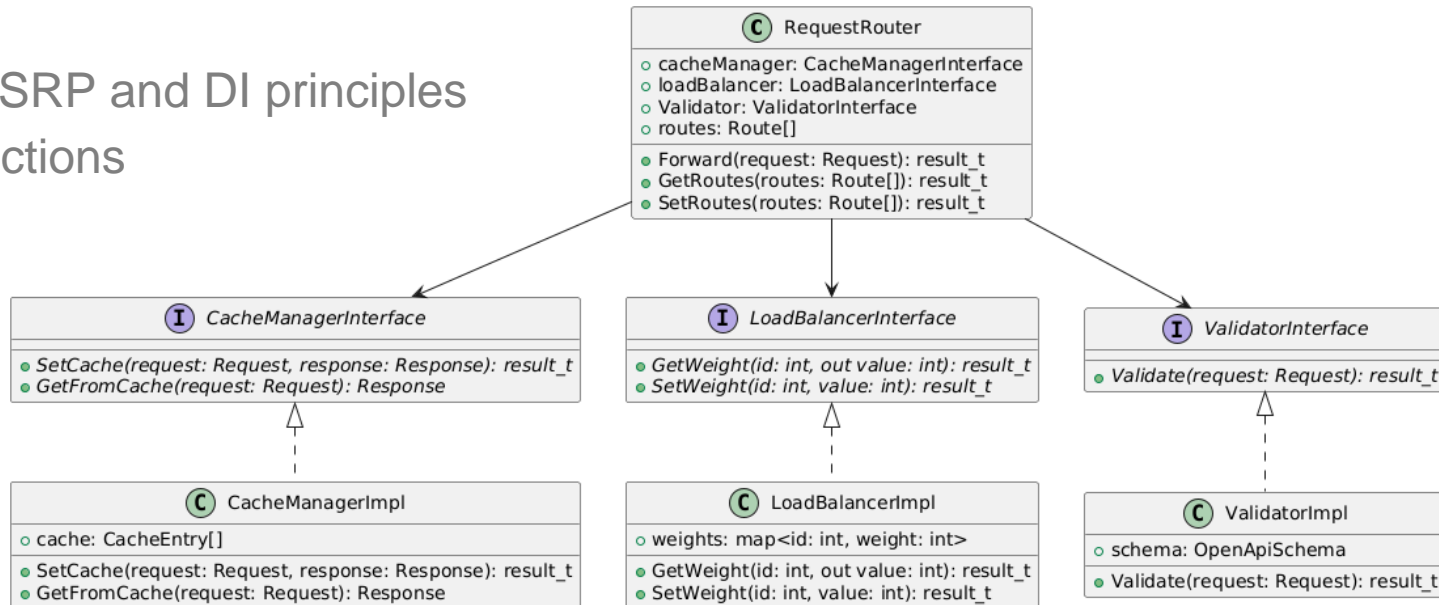

BASE, Microservices, RESTful API

# Design case for RequestRouter

Problems: many functions for one class

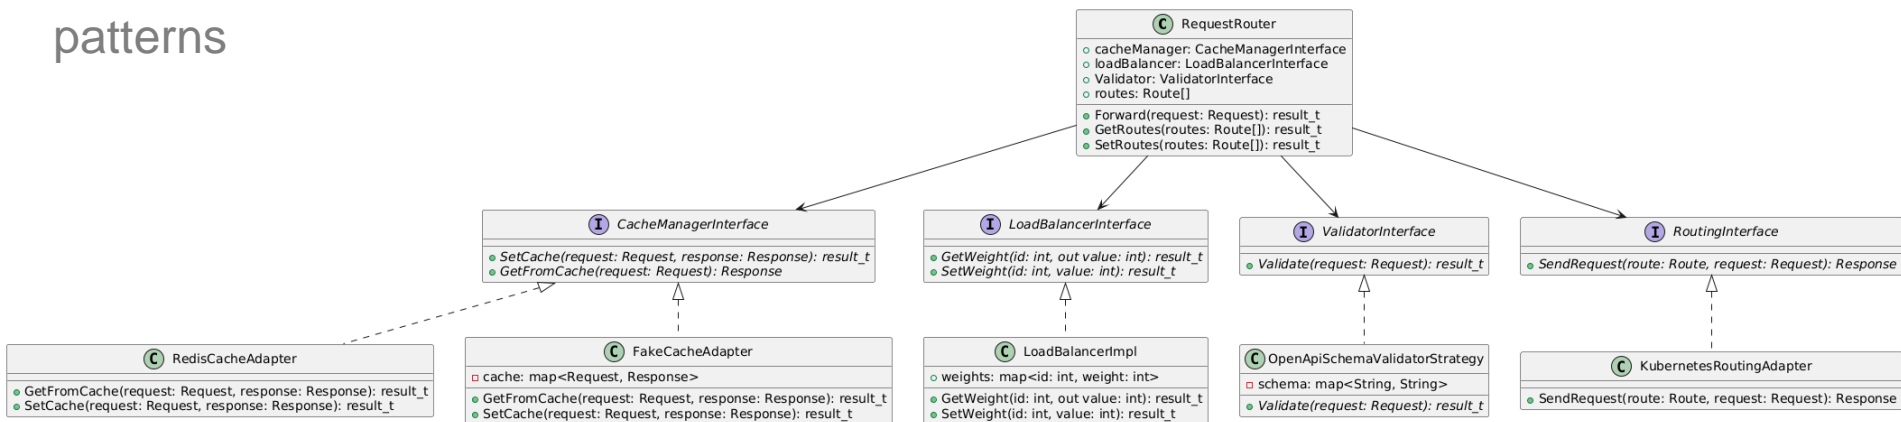

Solutions: use SRP and DI principles to delegate functions

# Design case for RequestRouter

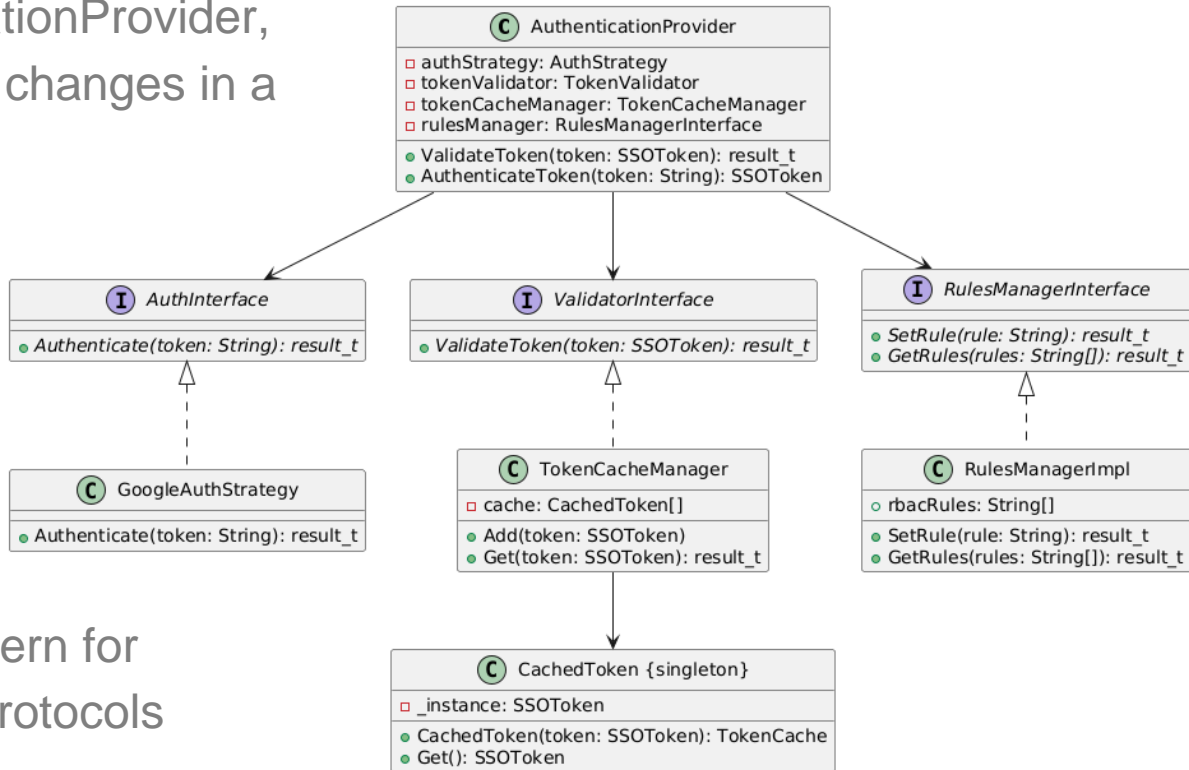

Problems: strong dependency on  
Kubernetes, OpenAPI schemas,  
cache storage

Solutions: use Strategy and Adapter  
patterns

# Design case for Authenticator

Problem: all auth processes are implemented in AuthenticationProvider, new auth methods require changes in a base class

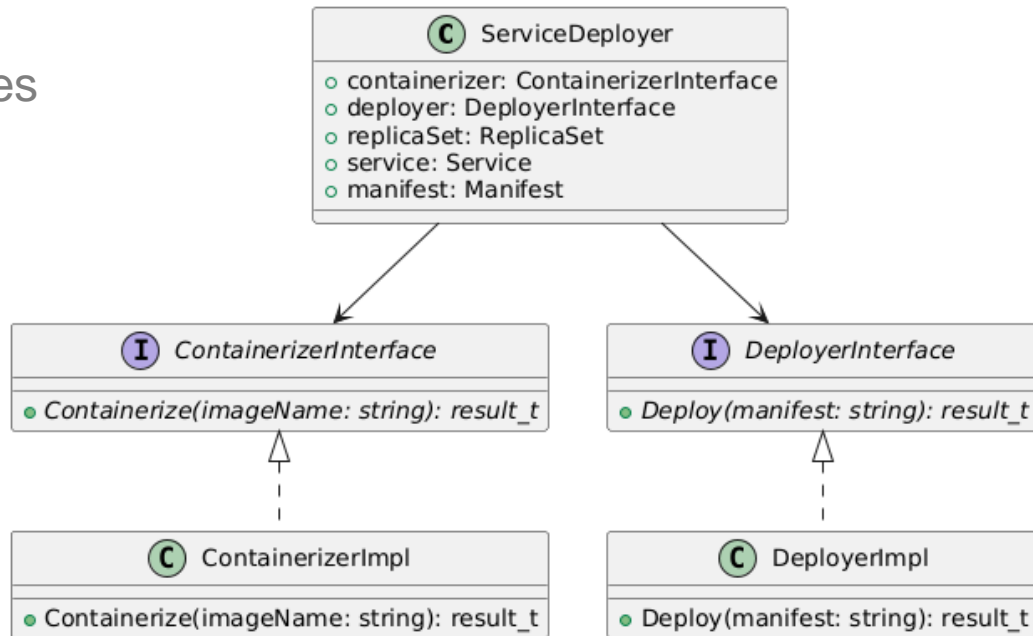

Solution: use Strategy pattern for separating different auth-protocols

# Design case of Service Deployer

Problems: implements many functions

Solutions: use SRP and DI principles to delegate functions

# Design case of Service Deployer

Problems: new deploy strategies  
require changes in ServiceDeployer;  
ServiceDeployer can work with  
different data, repository or  
orchestrator

Solutions: use DI principle, Adapter and  
Strategy patterns
