System Architect Secure integration of multiple services and centralized authentication		DevOps Engineer Efficient infrastructure management and traffic optimization		Developer Automate API documentation updates and ensure API compliance	
Simplify service interaction management	Ensure system security and scalability	Reduce workload related to managing infrastructure	Reduce workload related to managing infrastructure	Reduce workload related to managing infrastructure	Ensure compliance with API standards
Simplify integration between services for seamless communication	Implement Single Sign-On (SSO) for unified authentication Simplify integration between services for seamless communication	Centralize traffic management using API Gateway, including request validation	Automate Automate infrastructure scaling and load balancing balancing	Minimize time spent on routine documentation updates	Ensure API Customize error schemas are handling for compliant and updated error codes
Request Routing	Single Sign-On Audit (Traffic Logging)	Request Audit (Traffic Validation Logging)	Load Balancing Response Caching	OpenAPI Scheme Generation	Request Errors Handling and Response Customization
